

SAHRIS OBJECT PDF REPORT

Object Code: EFK-25-MM Blocks
Quantity: 22.00
Cultural Association:
Maker:
Production Place:

Description:

These samples consist of plaster-jacketed micromorphology blocks collected from the site of Erfkroon. The blocks consist of Pleistocene-age sands, silts, and gravels. The blocks are to be embedded with a polyester resin, then turned into petrographic thin sections for micromorphological analysis.

Provenance:

The micromorphology blocks were collected from five geological exposures in an eroded donga consisting of ancient overbank and fluvial sediments in the Erfkroon study area (Study Areas M, Upper F, N, Erfkroon Terrace, and "Dating Profile").
